Case Study

bess biodiversity & ecosystem service sustainability

Choosing the best model.....

Not necessarily those that produce the prettiest outputs!

AREA 4: Functional Performance Summary by Function for Site

MANAGEMENT ACTIVITY: No management activities proposed at this time.

ACRES: 37.2

INDIVIDUAL FUNCTION PERFORMANCE SUMMARY

	FUNCTIONAL ACRES	% FUNCTIONAL PERFORMANCE
Abiotic Functions Score (area weighted average)	BASELINE	BASELINE
	15.7	42%
ABIOTIC FUNCTIONS	Atmospheric cleansing	11.8 32%
	Carbon cycle support	18.4 49%
	Carbon sequestration	27.1 73%
	Carbon respiration	14.2 38%
	Organic matter export	12.9 35%
	Organic matter production	19.4 52%
	Erosion control	17.1 46%
	Soil retention	16.2 44%
	Sediment transport	9.5 26%
	Soil / substrate stability	26.1 70%
	Evaporation	15.1 41%
	Transpiration	10.5 28%
	Filtration	11.6 31%
	Groundwater recharge	5.4 15%
	Habitat formation	22.7 61%
	Channel diversity	0.8 2%
	Landscape connectivity	24.2 65%
	Natural flood regime	7.1 19%
	Streambed stability	1.0 3%
	Variable velocity	1.0 3%
	Infiltration	9.0 24%
	Interception	23.2 62%
	Nitrogen removal	16.1 43%
	Phosphorus retention	7.6 21%
	Pollinator support	22.0 59%
	Soil quality	20.8 56%
	Spatial separation	3.7 10%
	Subsurface flow	19.9 54%
	Temperature regulation	8.5 23%

	FUNCTIONAL ACRES	% FUNCTIONAL PERFORMANCE
Biotic Functions Score (area weighted average)	BASELINE	BASELINE
	17.1	46%
BIOTIC FUNCTIONS	Amphibian / turtle support	22.3 60%
	Bat support	16.5 44%
	Insect / invertebrate support	17.0 46%
	Large mammal support	14.2 38%
	Raptor support	17.7 48%
	Reptile support	19.8 53%
	Resident fish support	6.4 17%
	Small mammal support	12.0 32%
	Songbird support	20.2 54%
	Vegetation support	17.8 48%
	Natural plant succession	34.4 93%
	Plant growth	12.6 34%
	Plant reproduction	17.1 46%
	Dispersal	12.1 33%

Ecosystem Services

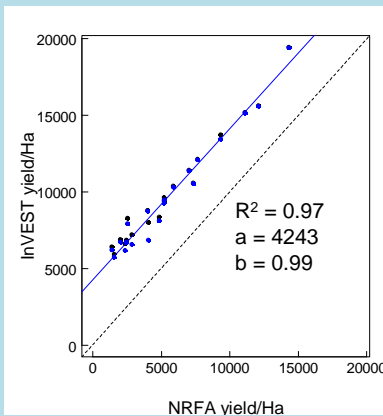

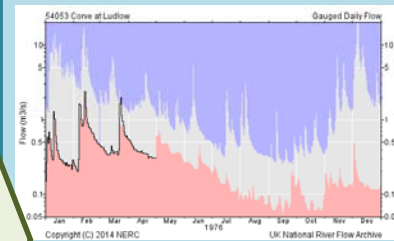

LUCI
LAND UTILISATION & CAPABILITY INDICATOR

InVEST

integrated valuation of
environmental services
and tradeoffs

VALIDATION

Empirical data for essential model testing

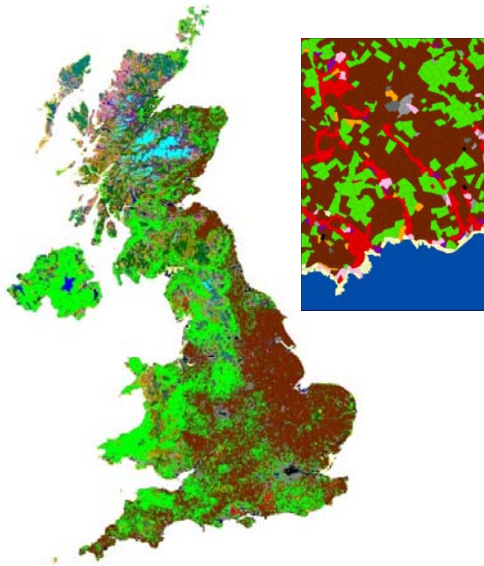

APPLICATION

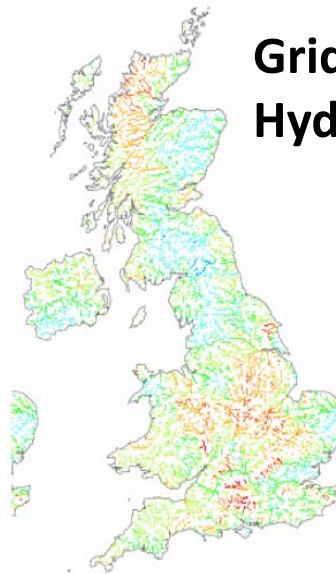

Evidence-based advice on land use impacts

VALIDATION

Example 1- InVEST water yield model

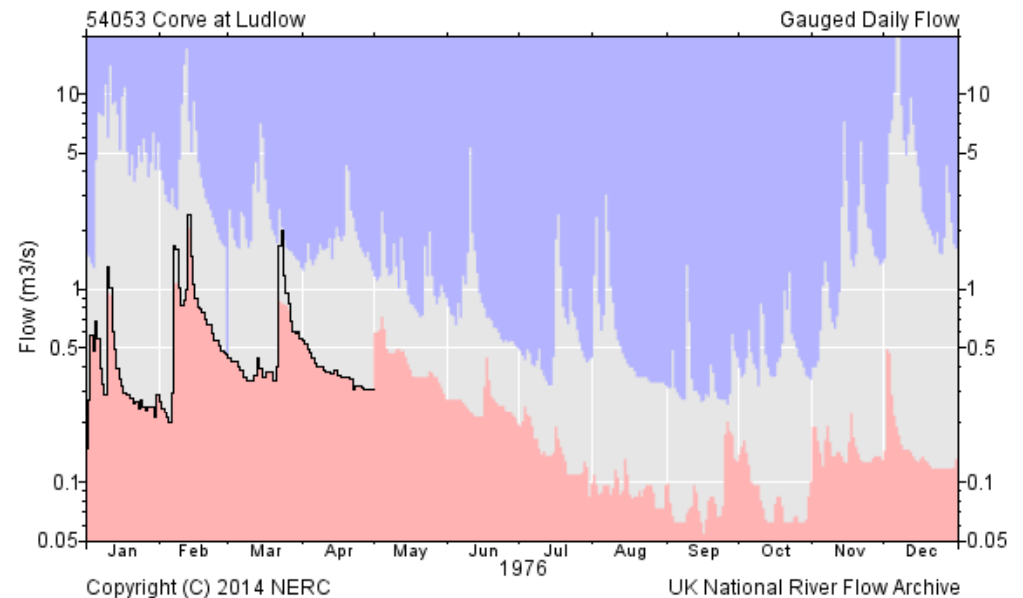

Model fitted for 20 test catchments that vary in land cover, geology and population size

VALIDATION

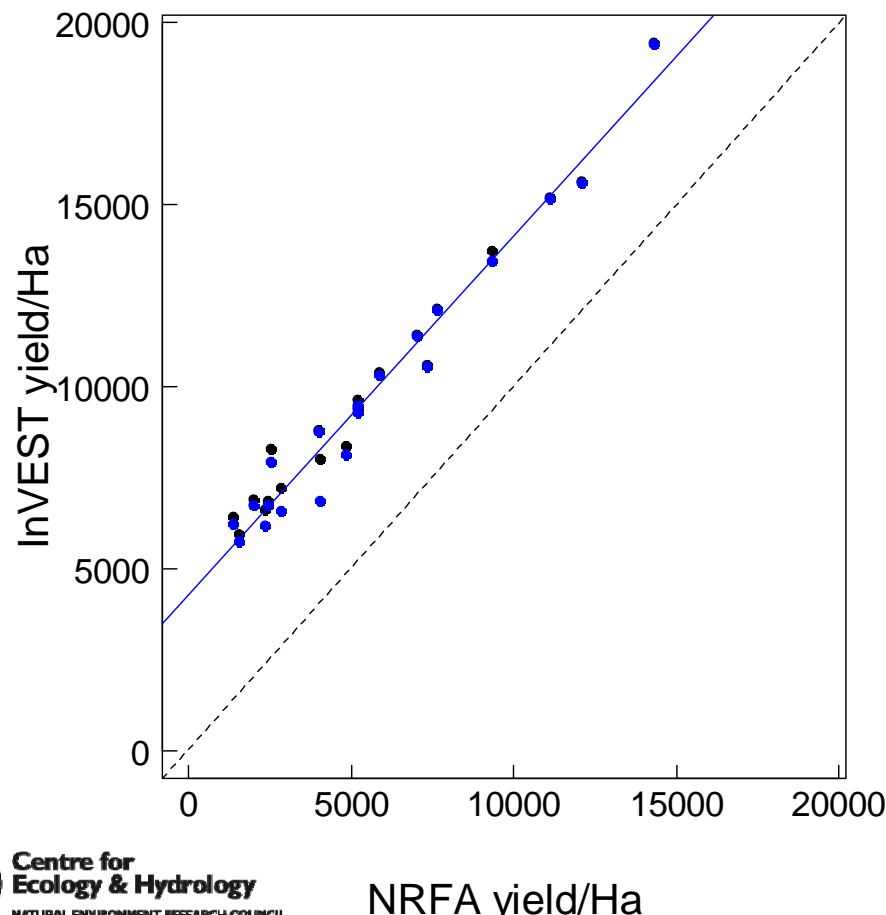

Validated against monitored river flow from the
National River Flow Archive (NRFA)

Using mean flow for same 10 years as model inputs

VALIDATION

Results: InVEST overestimates water yield per hectare, but by a consistent amount....

$$R^2 = 0.97$$

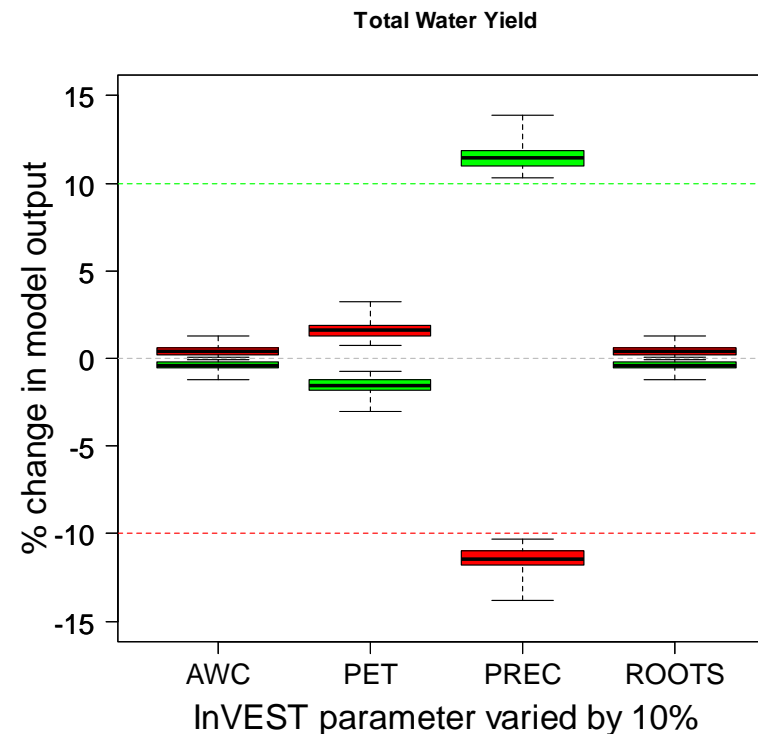

$$a = 4243$$

$$b = 0.99$$

VALIDATION

Sensitivity analysis:

- Models run with varying parameters +/- 10%
- Model most sensitive to precipitation and potential evapotranspiration

Conclusions

toliver@ceh.ac.uk

@Dr_dolittle_81

1. More **validation** of ecosystem service models is needed
2. And rigorous **comparison of models** to pick most appropriate for given region/ spatial scale
3. Mapping supply of ecosystem services is only one side of the coin- **demand management** is critical
