EIRIS
Water Risk Report, June 2011

This report explores corporate responses to water scarcity around the world. Our research identifies a significant proportion of global companies are facing at risk from water scarcity and highlights the most vulnerable within which water scarcity will begin to have an impact.

Despite this, our research shows only a handful of management systems and reporting mechanisms that it is worth. We conclude that the most resilient companies under review are not those taking to protect company's water risk and are therefore likely to protect company's water risk and are therefore likely to protect company's water risk and are therefore likely to protect company's water risk.

EIRIS
On track for Rio+20? How are global companies responding to sustainability?
EIRIS Economy Report, April 2012

This report examines the sustainability performance of over 2,000 global large cap companies. Our research identifies some excellent examples of corporate leadership on sustainability, along with signs that companies are moving sustainability a significant part of their future plans and strategies. We also see other indicators that companies are not recognizing the importance of sustainability, not only in terms of acting in a good 'stakeholder citizen'.

EIRIS imug
Biofuels
EIRIS Imug Biofuels Report, April 2012

However, a significant cloud of uncertainty is cast over the very broad range of activities across the board if companies are not recognizing the importance of sustainability, not only in terms of acting in a good 'stakeholder citizen'.

EIRIS
Executive summary

The world has witnessed the rapid growth of biofuel production over the past decade. This expansion has been driven by the need to meet growing global energy demands and the subsequent growth of biofuel feedstock production. The growth of biofuel production has been supported by regulatory policies and incentives that have encouraged production. As a result of these policies, several changes in regulations and targets for biofuels can be observed. These changes pose potential operational risks for future producers and the uncertainty around policy incentives could lead to investment in biofuels.

EIRIS
Key points

- Production of biofuels has grown internationally and the feedstocks according to the International Energy Agency (IEA) the global production of biofuels in 2011 was over 100 million tonnes (up from 50 million in 2007).
- Conventional production of first crop-based biofuels poses risks to consumers and investors, including rate of return and contribution to greenhouse gas (GHG) emissions, feedstock and other environmental concerns, and the potential for land use change and deforestation.
- There is an opportunity for engagement with these companies to ensure that the production of biofuels is done in a way that is sustainable and that the production of biofuels is done in a way that is sustainable and that the production of biofuels is done in a way that is sustainable.
